

PRVS Weekly P&L — Manager Guide

What service silo managers and parts managers must do for the daily and weekly P&L numbers to be right. June 2026 — v1.

P&L weeks run **Monday through Sunday**. Every number traces to an action below:

Revenue = WO Dollar Values, counted only when you click ✓ **Mark Completed**. **Labor** = tech clock-ins. **Parts cost** = wholesale × qty + freight, attributed by the part's **Service Silo** tag. Skip a step and the number is missing or lands in the wrong place.

SERVICE SILO MANAGERS

STEP 1 THE MOMENT A JOB IS SCOPED — before work starts

- Build the Work Order — **real Dollar Value, right silo**. The WO's Dollar Value IS the revenue number. No WO, or a \$0 WO = the job is **invisible** to the P&L, no matter how much work goes into it.
- Don't worry about status — the WO flips to In Progress **by itself** at the first tech clock-in.

STEP 2 EVERY DAY — keep your techs' time clean

- Right RO, right service at clock-in, **clocked out at day end**.
- Forgotten clock-outs force-close at 5 PM and create ⚠ **phantom hours** — one forgotten morning clock-in = a fake 9.5-hour day on your silo's labor.

STEP 3 WHEN THE BLUE “TECH DONE” CHIP APPEARS on a WO

- Your tech lead tapped “**Our work is done**” at the kiosk. That is your cue: **QA/QC the job and inform the customer**.

STEP 4 THE SAME WEEK THE WORK FINISHES — recognize the revenue

- Click ✓ **Mark Completed** on the WO. **This is THE revenue event**. Until you click it, Revenue Completed stays \$0 — no matter how finished the job is.
- Revenue counts in the week you click — **don't batch them up**.
- Clicked too early? ↩ **Reopen** pulls the revenue back out.

PARTS MANAGERS

STEP 1 EVERY PART YOU ENTER — tag the silo

- Set the **Service Silo** dropdown on **every part** — it marks the silos already “— on this RO” for you.
- A blank silo sends the part to the **Unattributed** bucket — one June week had **\$19,068** sitting there that no department answered for.

STEP 2 EVERY PART YOU ENTER — get the cost fields right

- **Wholesale cost is per unit** (the system multiplies by quantity).
- **Freight goes in its own field.** Together these are the parts-cost side of the P&L.

STEP 3 EVERY TECH PARTS REQUEST — add the missing silo

- Tech requests arrive **without a silo** today. Tag it when you process the request — match it to the RO's work order.

STEP 4 ANY OLD PART YOU TOUCH — re-tag it

- There is a backlog of untagged parts. Whenever you open one, **set its silo before you move on.**

READING THE FLAGS

When a report flags something, it points back at one of the steps above:

Flag	What it means	Who fixes it
Amber dot on a silo week	Hours or parts spent but no completed revenue — a WO was never Mark-Completed, or has no Dollar Value.	Silo manager
△ on calendar / timeline	Auto-closed session at 5 PM = phantom hours. The tech forgot to clock out.	Tech (mgr coaches)
Unattributed row	Parts with no Service Silo tag.	Parts manager
Blue Tech done chip	Tech lead finished — job is waiting on manager QA/QC + Mark Completed.	Silo manager

Where this is headed: this is the v1 P&L. Shop expenses, burdened labor, per-job hour tracking, and manager-facing daily reports come next — but they all build on the steps above. Get these right and everything that follows gets easier.
